Institute for Health Policy

Institute for Health Policy (IHP) is an independent research institution working to improve health and social systems in Sri Lanka and the wider region, by supporting, encouraging and informing policy change through quality research analysis and training. Consistent with the IHP's mission, we make as much of our output as possible available and widely accessible, with the intention that the widest range of stakeholders are provided with better information and understanding. We do this primarily by making most of our publications available online for free download via the IHP web site (<http://www.ihp.lk>).

About the IHP Health Accounts Unit

IHP's Health Accounts Unit is recognized as the leading centre in the region for health accounts development and estimation. Its staff were responsible for designing and developing Sri Lanka's health accounts system starting in 1998 and, in addition to maintaining that system ever since, have provided technical advice and support to the development of health accounts systems in a range of other countries throughout Asia and Europe. The core activities of the unit include maintenance and updating of the Sri Lanka Health Accounts system and development of its applications and new analytical extensions.

Preface

Regular tracking and reporting of health expenditure flows is vital to understanding and monitoring, Sri Lanka's health system. Such statistics need to show the level and changes in the volume and proportion of economic resources allocated to the production and consumption of health goods and services which, in turn, contribute to the health and well being of the nation. The original Sri Lanka Health Accounts (SLHA) system and Sri Lanka National Health Accounts (SLNHA) framework were designed by IHP staff, led by Ravi P. Rannan-Eliya, working under the direction of the Ministry of Health Management Development and Planning Unit and with the funding support of World Bank during 1998–1999. It has been updated on a continuous basis since then to ensure that the SLHA system remains compliant with evolving national needs and the latest international thinking.

This publication presents first estimates for Sri Lanka of health expenditure based on the new System of Health Accounts 2011 (SHA 2011), which has been endorsed for international reporting by WHO, OECD and Eurostat. For these estimates, IHP updated its SLHA system, which was designed to be compliant with the earlier System of Health Accounts 1.0 (SHA 1.0) standard, to also report statistics according to the new international standard. The revised SLHA system can now report estimates according to all three SHA 2011, SHA 1.0 and SLNHA frameworks.

In this new release, we report estimates in the Appendix Tables according to both the SHA 1.0 or SHA 2011 standards. Readers should note that the main difference in the two standards is that SHA 2011 focuses on reporting Current Expenditure on Health, which excludes capital expenditures, in contrast to SHA 1.0 which focuses on reporting of Total Expenditure on Health. However, during development of the new SLHA estimates it was determined that the aggregate value of Current Expenditure on Health was the same in both SHA 1.0 and SHA 2011 formats. IHP plans to continue releasing estimates in both SHA 1.0 and SHA 2011 formats in the foreseeable future, and will update earlier estimates accordingly with each new release.

National Health Expenditure Sri Lanka 1990–2014 is the fifth printed release of the SLHA estimates, updating the previous IHP publication *National Health Expenditure Sri Lanka 1990–2012*. This update incorporates a number of improvements and enhancements since the last release. The improvements include several changes in the underlying data sources and revisions to estimation methods in order to increase accuracy and ensure improved compliance with past and emerging international standards. With the refinement and improvement of methods and data sources, estimates of expenditure for all previously reported years have been revised to ensure consistency. This publication thus provides new, updated estimates for all years since 1990, to ensure full comparability of the SLHA estimates across different years. Comparisons of Sri Lankan health expenditure over time should accordingly be based on this publication, rather than on our earlier published estimates.

An electronic version of this report as well as the previous reports and additional detailed data are available online at <http://www.ihp.lk/slha>

As the SLHA estimates are continuously updated, there is potential for revisions of data after publication of this report, and readers are advised to refer to the online version for the most up to date statistics. The IHP website also provides information and results from the other analyses linked to the Sri Lanka Health Accounts.

Acknowledgements

The development of Sri Lanka Health Accounts has only been possible with the support of countless individuals and agencies over many years. Without being exhaustive, we wish to express our sincere thanks to many who have made significant contributions towards this endeavour.

For the work that went into this publication we greatly appreciate the support of Dr. P.G. Mahipala (Director General Health Services, Ministry of Health) and the Secretaries of the Ministry of Health, Mr. N.G. Dayaratne (former Director General, Department of State Accounts, Ministry of Finance and Planning), Mr. Sumith Perera (Director, Department of State Accounts, Ministry of Finance and Planning), Ms. Rukmal Abayawickrema (former Additional Director, Department of National Budget, Ministry of Finance and Planning), the chief secretaries and staff of Provincial Councils, the directors and staff of Provincial Departments of Health, Chairman and staff of the Finance Commission, Secretaries of Ministry of Defence, Surgeon Rear Admiral N.E.L.W. Jayasekara (Director General Health Services for Commander of Navy), Brigadier Dr. K.P. Sumanapala (Director Army Medical Services for Commander of Army), Air Commodore D.M.S. Karunaratne (former Director General Health Services for Commander of Air Force), Dr. Rohitha Fernando (Chief Medical Officer, Police Medical Services Division), Mr. R.A.A.K. Ranawaka (former Secretary, Ministry of Local Government and Provincial Councils) and the staff of Management, Planning and Development Unit at the Ministry of Health, Local Government Bodies, Chairman and staff of Insurance Board of Sri Lanka (IBSL), colleagues in the Department of Census and Statistics (DCS), Central Bank of Sri Lanka (CBSL), and other government agencies for facilitating the collection of data. A special note of appreciation is extended to the many individuals and organisations in the private sector who have cooperated over the years in providing data when requested including the management of the insurance companies in Sri Lanka, respondents in private hospitals, laboratories, ambulance companies, and other private sector companies including banks and other statutory bodies. We also express our appreciation for the support and cooperation given by donor agencies and non-profit organisations.

Finally, the authors wish to thank Dr. Reggie Perera (former Secretary, Ministry of Health and Senior Fellow, IHP) for his valuable advice, Dr. Sarath Samarage (former Deputy Director-General Health Services Planning) for support and guidance over the years in compilation of the accounts. Sanil de Alwis, Tharanga Fernando, Mr. M. Balasubramanium and J.M.H. Jayasundara who made significant contributions to earlier work. We thank Ruvani Gamage, Gehan Perera, Praveen Wijewardana, Peter Christian and the other support staff at IHP for their contribution to the process of data collection, analysis and reporting.

The collection and analysis of data and writing of this publication was done by Sarasi Amarasinghe, Rehana Thowfeek, Chamara Anuranga, Dr. K.C.S. Dalpatadu and Dr. Ravindra P. Rannan-Eliya. The graphic design and desktop publishing was by Harees Hashim.

How has current expenditure changed?

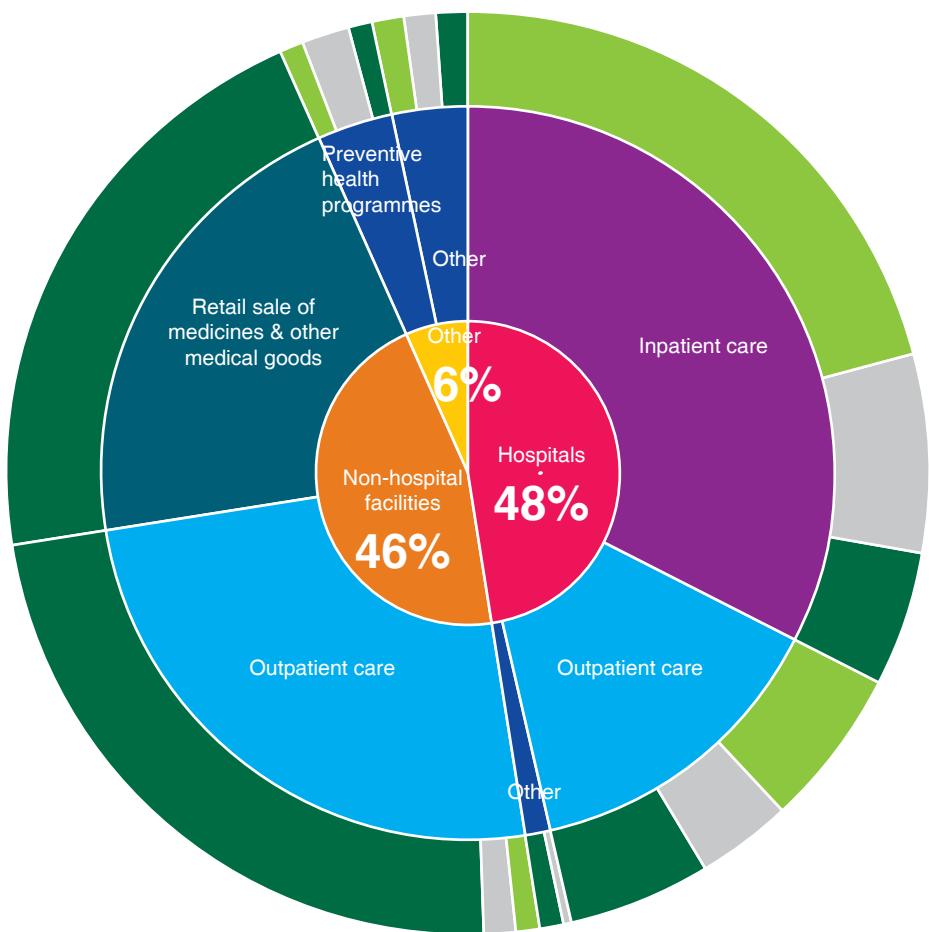

Who paid for it?

What was it spent on?

Current spending on health - where, what and by whom

Institutions

- Hospitals
- Non-hospital facilities
- Other

Services

- Inpatient care
- Outpatient care
- Retail sale of medicines and other medical goods
- Other

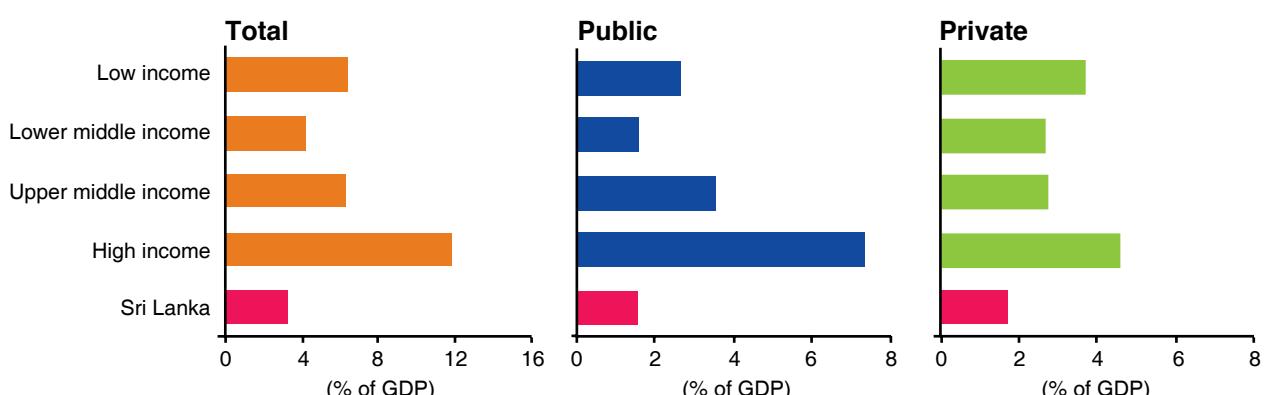

Financing sources

- Central government
- Provincial and local authorities
- Private

Notes

1. Non-hospital facilities include ambulatory care providers (e.g. clinics of private physicians), ancillary service providers, pharmacies and other retail outlets of medical goods.
2. Central government refers to Ministry of Health, other government ministries, departments and agencies.

How does total health expenditure compare with other countries?

1. Background

About this report

This report presents estimates of health spending in Sri Lanka for the period 1990–2013, with preliminary estimates for 2014. This extends our previously published estimates, which covered 1990–2012.

Expenditure is reported by sources of funding, function of care, type of provider and revenues of financing primarily according to the System of Health Accounts 2011 standard, but additional data are provided to allow readers to derive estimates according to the older SHA 1.0 standard. It should be noted that the Current Expenditure on Health amounts are the same whether measured according to either SHA 2011 or SHA 1.0 standards: the main differences between the two standards relate to how this total is further classified. Further disaggregation by province and district is also presented for certain components of expenditure. The report also presents estimates on the level of spending and cross tabulates expenditure by source, function and provider to profile the mix of funding flows.

The tables and figures in this publication present expenditure in terms of current and constant prices. Constant price expenditure adjusts for the effects of inflation using the implicit GDP deflator provided by the Central Bank of Sri Lanka. Thus, the constant price estimates indicate what expenditure would have been if 2013 prices had prevailed in all years.

The section on international comparisons of expenditure is made with a selection of territories in the Asia-Pacific region, drawing on the work of Asia-Pacific National Health Accounts Network (APNhan), WHO and OECD.

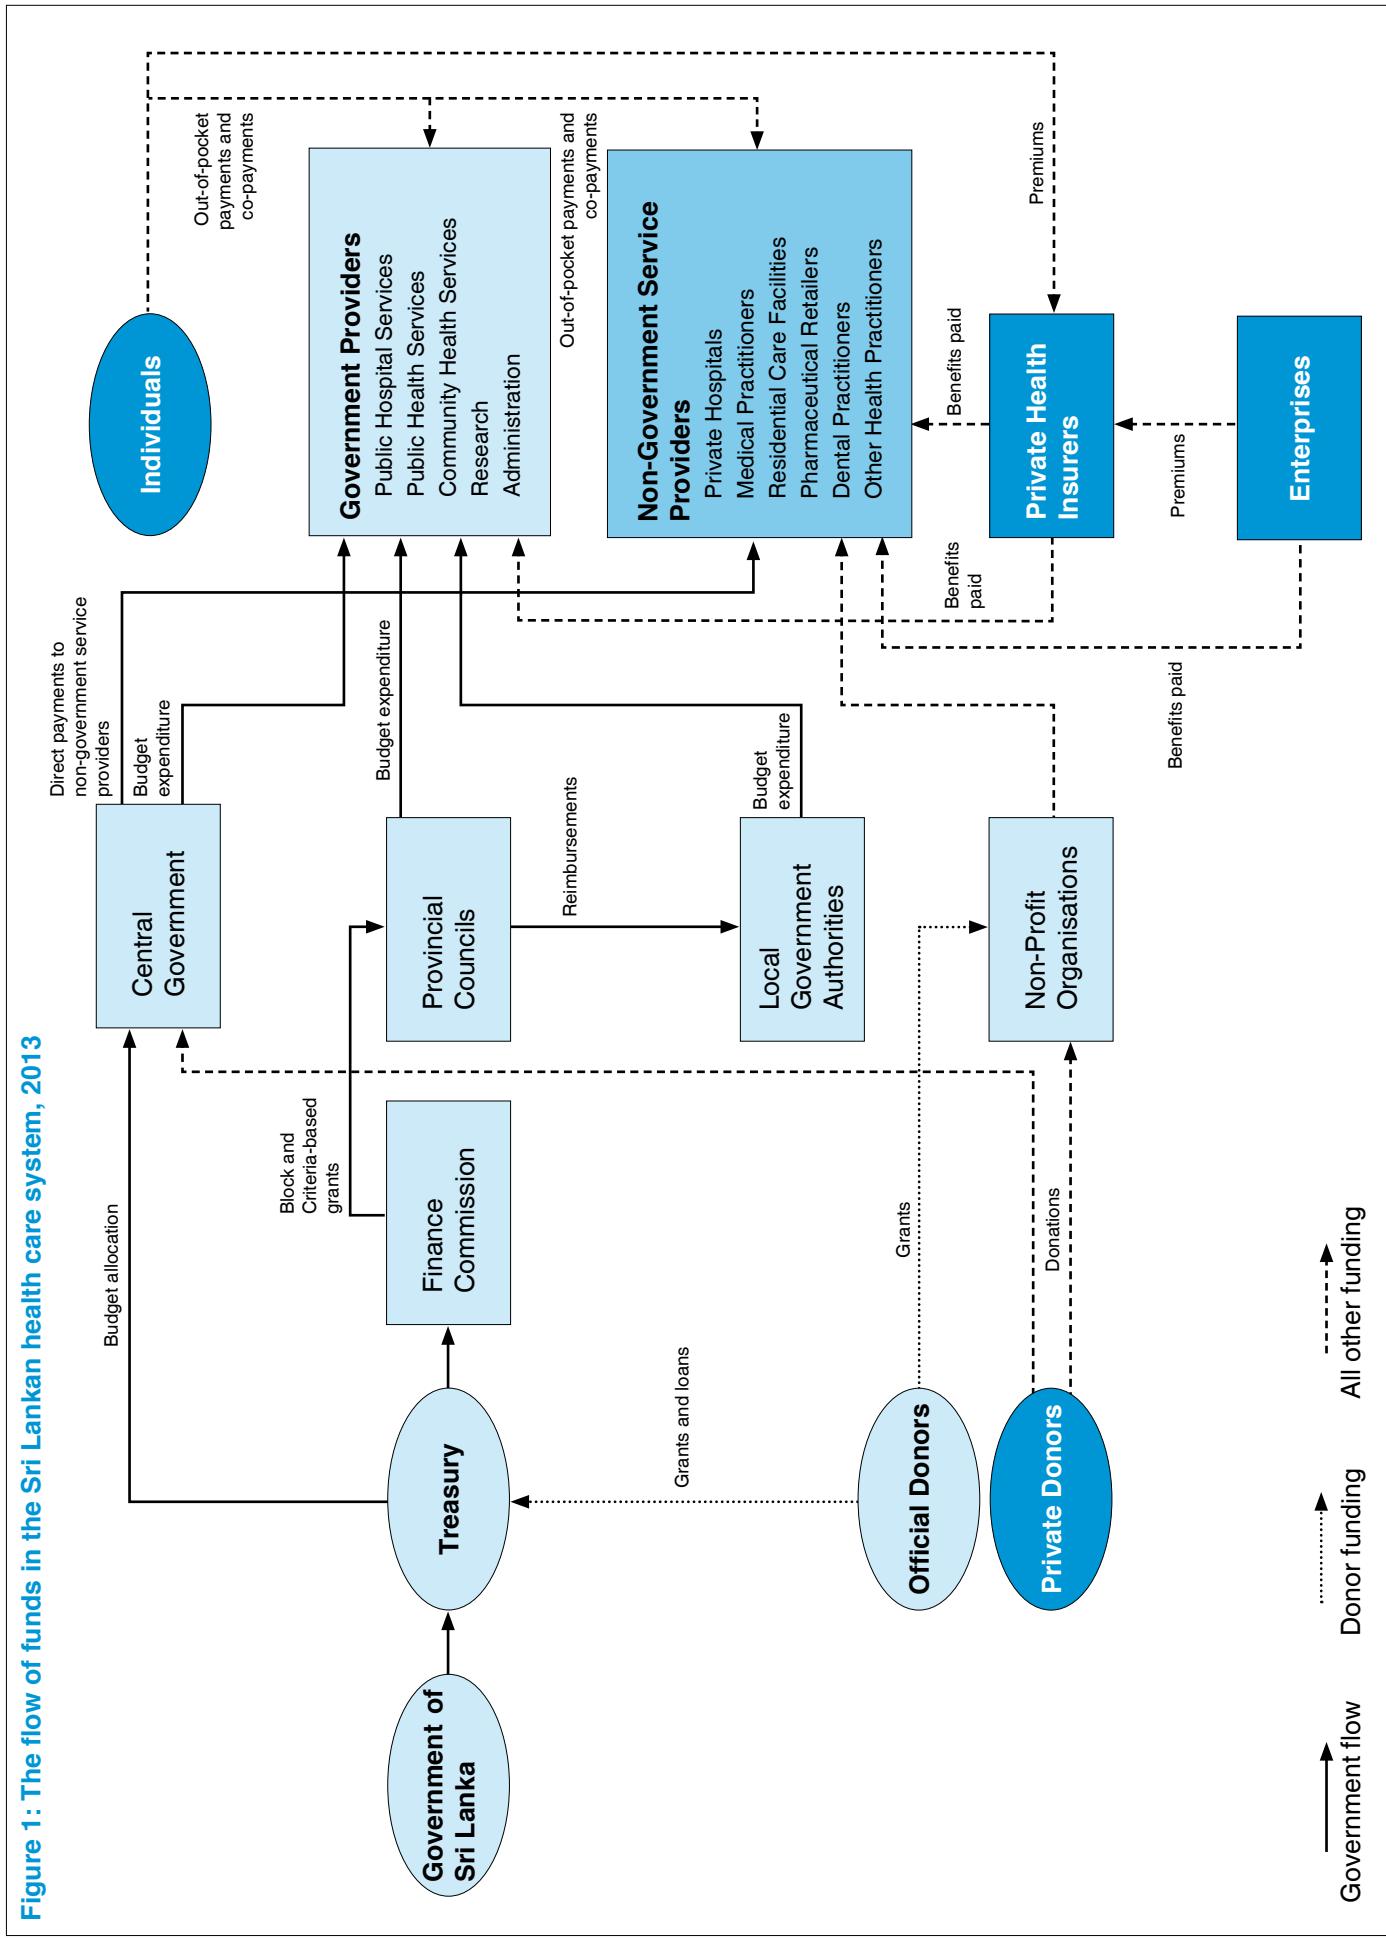

The final chapter provides technical details on how the estimates were produced. These cover definitions, data sources and methods used. The appendix then presents more detailed estimates and statistical tables. These include selected tables in both SHA 1.0 and SHA 2011 formats for selected years to aid international comparison. Tables for all years are provided online at <http://www.ihp.lk/slha>, in addition to electronic versions of all tables and figures in this publication.

Structure of the health sector and flow of funds

Health care in Sri Lanka is provided by the government, private sector and to a limited extent by the non-profit sector. The government sector is predominantly financed from general revenue taxation, while private sector financing is through out-of-pocket spending, private insurance, enterprise direct payments, insurance paid for by enterprises, and contributions from non-profit organizations. Donor financing is largely channelled through the government sector and in certain instances through non-profit organisations. Figure 1 provides a diagrammatic representation of the flow of funds in the health system, and for the first time in this report we provide in Appendix B a presentation of funding flows from revenue sources to financing schemes according to the SHA 2011 format.

Public sector healthcare is universally accessible to the entire population of Sri Lanka and is almost wholly free of charge. A few public hospitals accommodate one or two paying wards, where patients are charged additional fees, but their turnover is negligible in comparison to the rest of public sector delivery. Two revenue-generating, public sector hospitals also operate autonomously under the supervision of their own boards, namely the Sri Jayewardenepura Hospital and the Vijaya Kumaratunga Hospital. In mid 2008, the controlling stake in the private sector Apollo Hospital (presently, Lanka Hospitals) in Colombo was transferred to a government-owned commercial enterprise. However, as this hospital still operates as a market enterprise, the SLHA continues to treat it as a private sector entity.

The government sector comprises the central government, the Provincial Councils, and local governments, consisting of municipal councils, urban councils and Pradeshiya Sabhas. The central government provides budgetary funding to the Ministry of Health (MOH), which delivers services directly through its own programmes and the hospitals that are under the purview of the ministry. Some of these central programmes also support and operate through the programmes administered by lower levels of government. The bulk of donor funding is channelled through the Treasury, while some donor funds are disbursed directly through the relevant programmes or projects.

The provincial government financing and services are administered by the Provincial Directors of Health Services (PDHS) offices, which in turn deliver services through the provincial, district general, base, divisional hospitals, primary medical care units and Medical Officer of Health (MOOH) units. Most Provincial Council funds are sourced from the Treasury and channelled through the Finance Commission.

The expenditure of local governments is mainly financed from their own revenue but approximately 70% or more of salary costs is reimbursed by Provincial Councils. Local governments have their own service mandates and mainly deal with preventive and outpatient care.

Revision process

IHP updates the SLHA estimates on a continuous, annual basis, and the results presented in this publication incorporate revisions to the previous set of published estimates (Amarasinghe et al. 2014). The statistics presented here were current as of November 2015.

This report presents first estimates produced based on SHA 2011 (OECD, Eurostat, and WHO 2011). From 2015, IHP plans to report estimates according to all three frameworks: SLNHA, OECD SHA 1.0 (OECD 2000) and SHA 2011(OECD, Eurostat, and WHO 2011) for the full time series from 1990.

Several other significant revisions are reflected in this version of estimates following the introduction of new data sources and the development of new methods. The methodology used to estimate funding from external donors has been substantially revised and improved following a special study of available data sources. This has been used to generate a new time series on external financing flows since 1990. Data collected directly from the donor agencies are now cross-validated using the databases maintained by the Finance and Health Ministries, data reported annually by major donor countries to the Development Assistance Committee (DAC) of the OECD, and the official reports of key donors.

Geographical allocation of out-of-pocket expenditure has been revised using estimates from Household Income and Expenditure surveys

(HIES) conducted by the Department of Census and Statistics (DCS). Unlike earlier years, the HIES 2012 covered the entire island including Eastern and Northern provinces enabling more reliable estimates for these areas. These and other data have been used to improve the estimates of the distribution of out-of-pocket expenditure allocation according to the district of beneficiaries.

Estimates of local authority expenditure have improved due to better coverage of the regular IHP survey of these entities. In particular, the response rate in the 2015 survey improved, with response rates from local authorities in the Eastern and Northern Provinces increasing substantially.

A systematic review during 2015 also identified several new items of expenditure that had previously been not captured, thus increasing the overall comprehensiveness of the SLHA estimates.

2. Current Health Expenditure

2.1 Trends in current health expenditure

Current expenditure on health goods and services in Sri Lanka in 2013 is estimated as Rs. 258 billion (Table 1). This represents an increase of Rs. 31 billion on the preceding year, and a 14% increase in nominal terms. Spending in 2014 is provisionally estimated to have increased by 12% in nominal terms to Rs. 289 billion. Overall, current health expenditure (CHE) tripled in real terms between 1990 and 2014 (Figure 2).

2.2 Health expenditure in relation to GDP

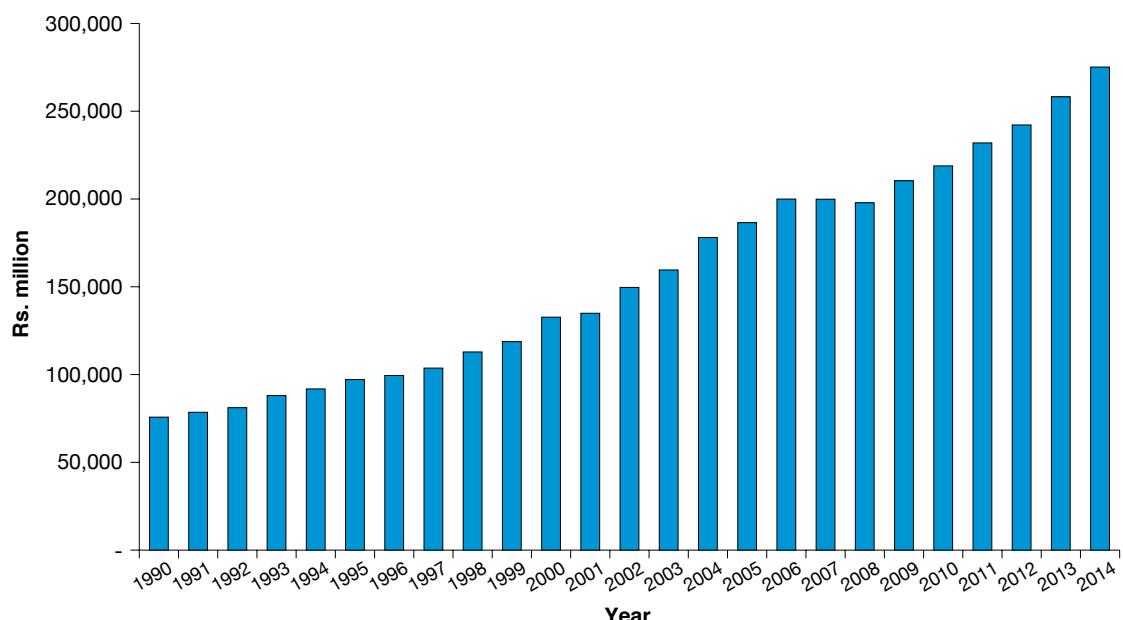

The ratio of CHE to GDP is estimated as 3.0% in 2013 and 2014, and it fluctuated between 3.0% and

3.7% during 1990–2014 (Figure 3). Both GDP and CHE grew in nominal terms in each year from 1990 to 2014 but the trend in the ratio of current health spending to GDP has not been smooth, as seen in Figure 3. It fluctuated between 3.0% and 3.3% pre-2001, then stabilized at approximately 3.6% till 2006, after which it declined and remained at 3.0% from 2012.

2.3 Total health expenditure

Total expenditure on health goods and services and capital formation in Sri Lanka in 2013 is estimated as Rs. 285 billion (Table 1). This represented an increase of Rs. 36 billion over the preceding year, which is a 15% increase in nominal terms. Total expenditure on health in 2014 is provisionally estimated to have been Rs 321 billion.

Figure 2: Current expenditure on health in real values (2013 prices), 1990–2014

Notes

1. Real values are expressed in terms of 2013 prices.
2. 2014 estimates are provisional.

Source: Table 1.

The ratio of total health expenditure to GDP provides an indication of the proportion of overall economic activity contributed by the health sector. It is estimated that total expenditure on health accounted for 3.3% of GDP in 2013, which is a drop from the level of 3.7% of GDP in 1990 (Table 2). In the years 2002–2006 the health to GDP ratio reached its highest levels ever, peaking at around 4%.

2.4 Health expenditure per person

As the population grows, health expenditure will also increase at the same rate, if the average expenditure on healthcare for each person in the community

remains constant. This means it is essential to examine health expenditure on a per person basis. This removes the influence of changes in the overall size of the population from the analysis. During 2013, the estimated per person current health expenditure was Rs. 12,535 or US\$ 97 while per person total health expenditure was Rs. 13,841 or US\$ 107. Provisional estimates indicate that current health expenditure increased to Rs 14,000 or US\$ 107 per capita in 2014, and per person total health expenditure to Rs 15,500 or US\$ 119 (Table 3).

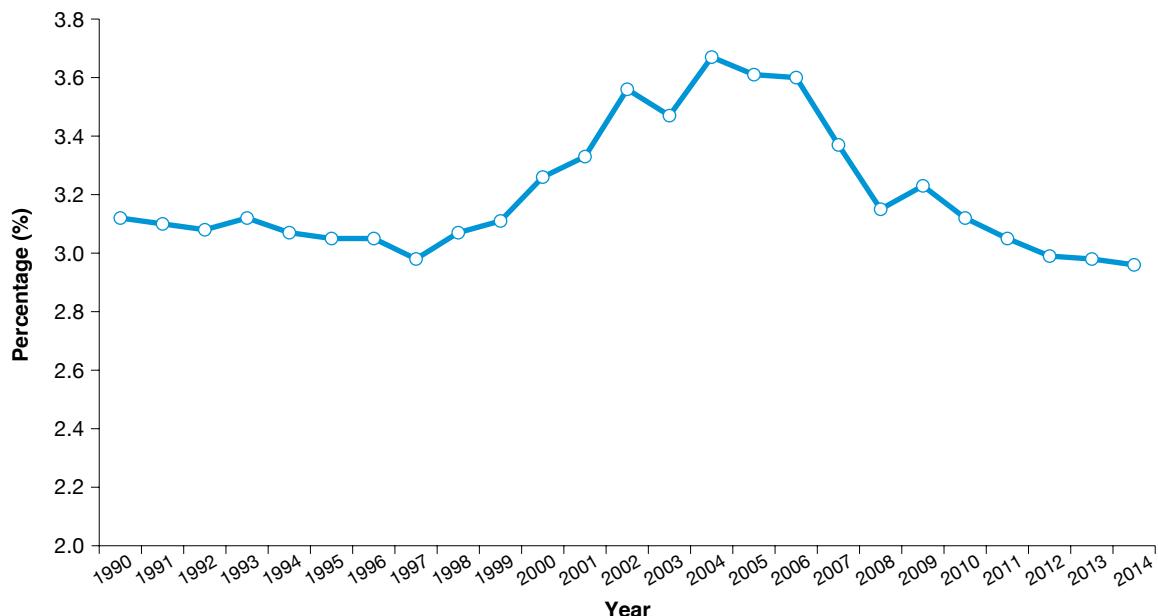

Table 1: Current, capital and total expenditure on health, nominal and real values (2013 prices), 1990–2014

Year	Nominal (Rs. million)			Real ^(a) (Rs. million)		
	Current expenditure on health	Capital formation	Total health expenditure	Current expenditure on health	Capital formation	Total health expenditure
1990	10,039	1,838	11,877	75,746	13,866	89,612
1991	11,552	1,286	12,838	78,517	8,739	87,256
1992	13,120	2,198	15,318	81,125	13,589	94,715
1993	15,581	1,646	17,228	88,018	9,299	97,318

3. Financing of health expenditure

3.1 General trends

In 2013, government financing of health expenditure was Rs. 112 billion, compared with Rs. 145 billion from private sources (Table 4). This represented 43% of total financing in the health sector in that year. Preliminary estimates indicate that government financing increased to Rs 134 billion and 46% of total financing in 2014.

During 1990–2014 the relative shares of public and private financing remained similar (Figure 5) with private financing consistently, but modestly, higher than the public contribution over the entire period.

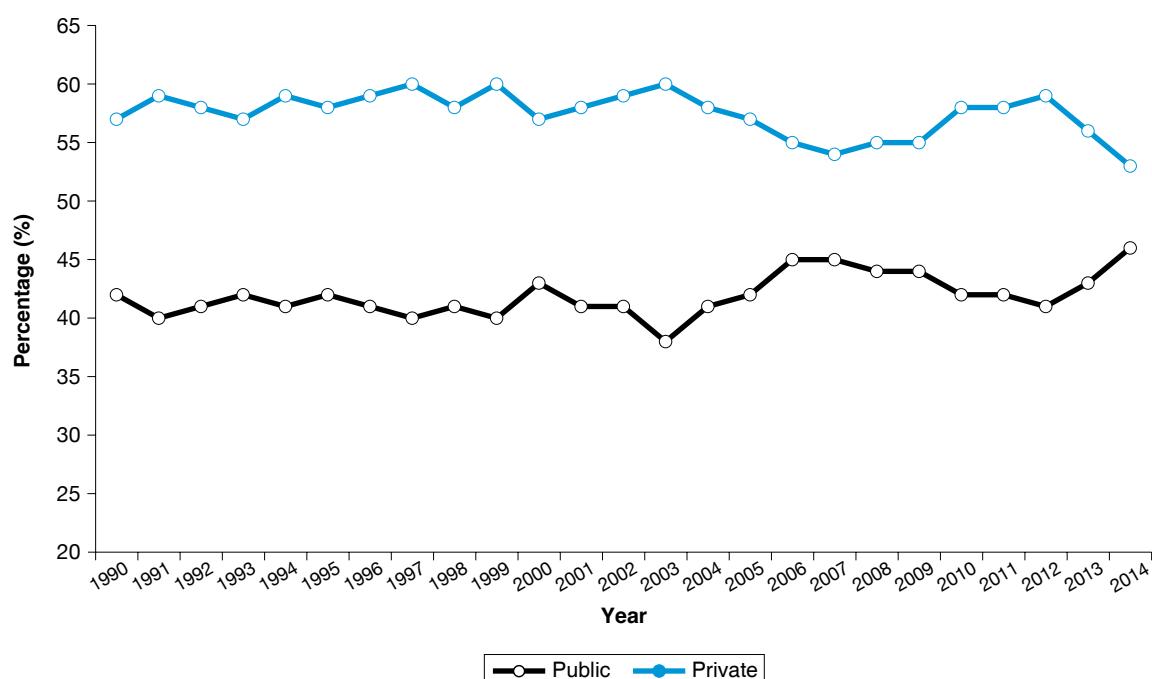

Public sector financing of health was 1.3% of GDP in 1990 while private sector financing was 1.8%.

Public sector financing fluctuated between 1.2–1.6% of GDP during 1990–2014 (Figure 6) while private sector financing fluctuated between 1.6–2.1%.

3.2 Government financing

Table 5 and Figure 7 show that the MOH share of total government financing has increased from 39% in 1990 to 63% in 2014. During 1993–2014, MOH accounted for the largest share and Provincial Departments of Health (PDOH) for the second largest share of government financing. In 2013, the MOH share of public sector financing was 62%, while the provincial governments financed 31%. Local government financing was 2% and the Employees Trust Fund, which is a form of social security, contributed 0.1% (Figure 8).

Figure 8: Government current health expenditure by financing source (%), 2013

Source: Table 5.

3.3 Private financing

Figure 9 and Table 6 show that the bulk of private sector financing consists of household out-of-pocket expenditure, which amounts to 85% of private expenditure throughout the entire period under review. Expenditure by companies to provide healthcare and medical benefits to their employees has been the next largest source of private financing (5–8%).

The contribution from private health insurance as a share of private financing substantially increased from a low level of 1% in 1990 to reach 5% by 2007, which it has maintained since then. The non-profit sector has maintained its share of private financing at 2–3% throughout.

A small share of private financing is by healthcare providers themselves from their own resources, principally for new capital investment in hospital services. The funding on CHE by providers' own resources remained less than 0.3% during 1990–2014.

Figure 10 shows the overall composition of private financing in 2013. Out-of-pocket spending by households remains the predominant element at 87% of total private financing, followed by employers at 7% and insurance with 5%.

3.4 External donor financing

External donors in Sri Lanka largely comprise official multilateral or United Nations (UN) agencies, such as the World Bank, WHO and the Global Fund to Fight AIDS, Tuberculosis and Malaria, and official bilateral agencies from countries such as Japan and Korea. Much smaller flows of external financing are also contributed by non-governmental and other private organizations.

Health sector financing from external donors in Sri Lanka consists mostly of grants and to a lesser extent loans, and is channelled in two ways. Funds from most major donors, such as World Bank and the Japanese International Corporation Agency, are channelled through the Treasury, while the rest is sent directly to the programme or institution that administers the funds. Financing from donors that is channelled through the Treasury is not classified as external financing in the SLHA estimates of spending by financing source, and is reported instead as government financing. This reflects the fact that this expenditure is incorporated into the government budget and is reported as such by the government. It is also important to note that foreign loans from agencies, such as the World Bank, must ultimately be paid back from general revenue taxation, and so the ultimate source of financing is the government, and by extension Sri Lankan households through taxation.

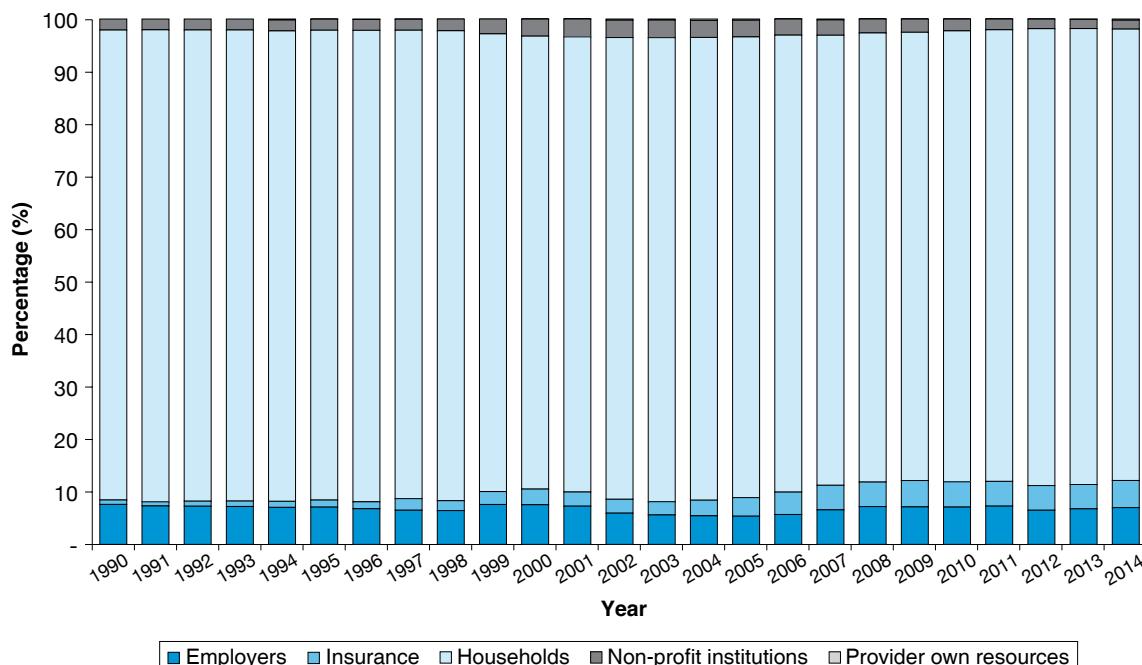

As noted, the external donor financing reported in the SLHA estimates of spending by financing source consists only of amounts that have not been channelled through the Treasury, and instead have been transferred directly from external donor agencies to healthcare providers. These have remained less than 2% of CHE during the time period covered in the SLHA (Table 4). These funds mostly comprised financing received from agencies such as WHO and United Nations Children's Fund (UNICEF). However, even if external donor financing channelled through the Treasury is included, total donor funding of CHE has typically accounted for less than 4% of total public spending during the period. Details of this additional financing is given in Chapter 7 and in Appendix B in the tables of flows from revenue sources to financing sources.

health sector is by the government and a significant part of this is financed by donor funding that is channelled through the Treasury for infrastructure projects in the health sector. However, there has been a growing level of spending by private hospitals, as a result of which expenditure by healthcare providers increased from 6% in 1990 to 14% in 2014: over 10% of total capital expenditure for the last fourteen years. This is accounted for mainly by a number of large, new private hospital investments and extensions of existing private hospitals (Table 7).

3.5 Financing of capital expenditure

Expenditure for capital formation is allocated largely to building and improving hospitals and purchasing plant and equipment. Much of the expenditure in the

4. Health expenditure by function

4.1 Current expenditure

The SLHA systematically classifies the purposes or functional uses of health expenditure (Table 8). Current expenditure is used for a range of functional purposes, while capital expenditure is used to invest in new capital infrastructure and equipment. For the most part current expenditure as reported by the government is equivalent to what the SLHA terms current expenditure.

Inpatient and outpatient care services

The largest part of health spending is for curative care (that is the combination of inpatient and outpatient care services). This was around 53% of CHE in 1990, and rose to 58% by 2013 (Table 9 and Figure 12). Of the curative care expenditure of 53% of CHE in 1990, 29% of it was outpatient care and 24% inpatient care. During the subsequent years, the inpatient share has increased steadily. By 2013, inpatient spending accounted for 37% of CHE, and outpatient spending 21%. In the provisional estimates for 2014, the inpatient share increased to 39% (Figure 13).

Inpatient care is mainly financed by the public sector, which accounted for 83% of expenditure in 1990 (Table 10). In 2013, this dropped to 75%. Outpatient care was mainly financed by the private sector, which was around 82% in 1990 but by 2013 decreased to 74%.

Distribution of medicines and medical goods to outpatients

The second major component of spending on personal medical services is on medical goods dispensed to outpatients, which was around 25% of CHE in 2013, and provisionally 24% in 2014. This category comprises not only sales of medicines and other medical goods from pharmacies and other retailers, but also medicines and other medical goods provided to outpatients in the public sector. Overall, about 87% of the expenditure to supply medicines and other medical goods to outpatients was privately financed, mostly by household out-of-pocket spending.

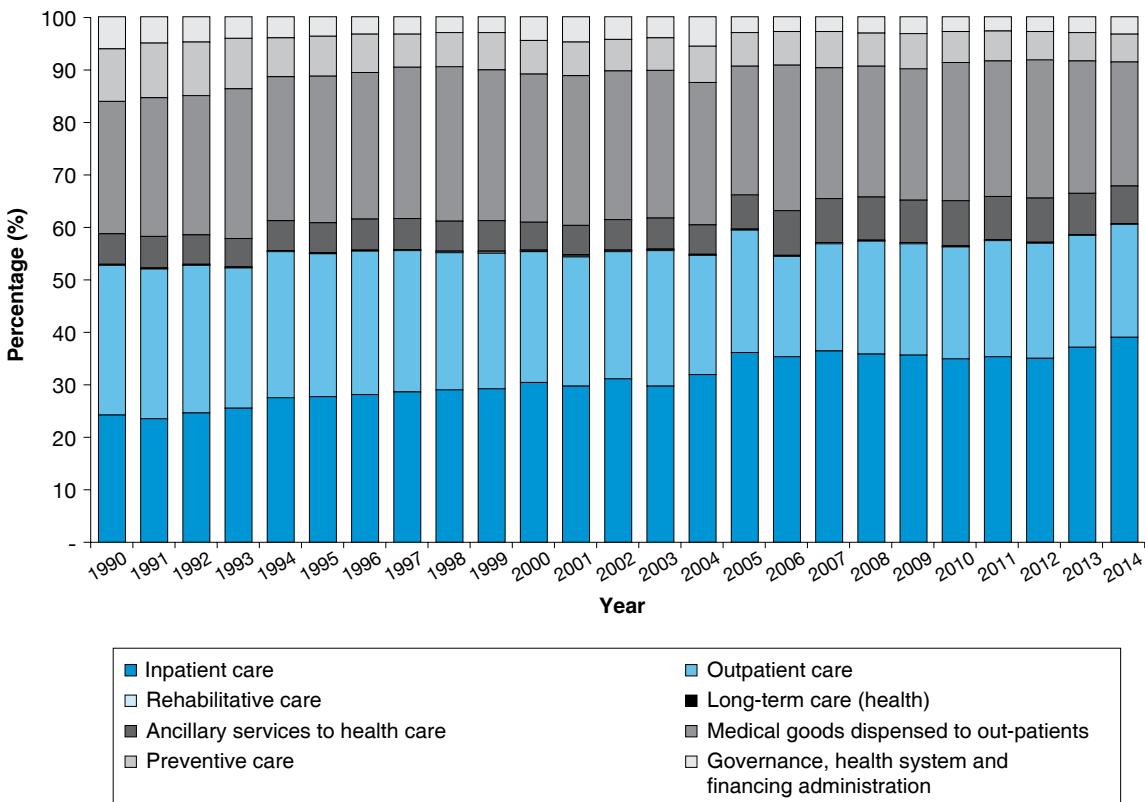

This category accounts only for a portion of overall expenditure on medicines in Sri Lanka's health sector.

Following international reporting standards, the SLHA reports expenditure on medicines and medical supplies used for inpatient care at hospitals within inpatient care.

Preventive care

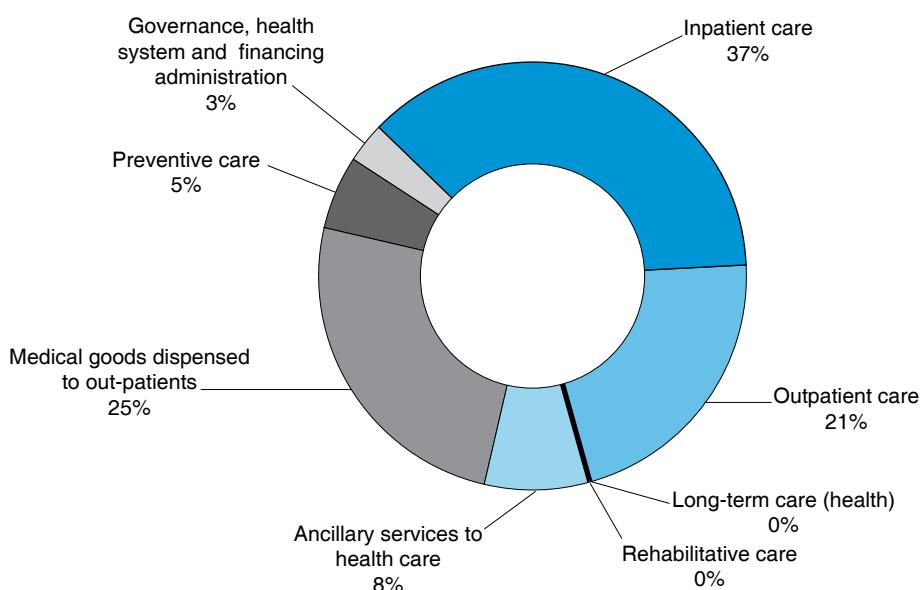

Preventive care expenditure decreased as a share from about 10% of CHE in 1990 to about 5% in 2013. The decline in the share of preventive care in CHE was due solely to a decline in central MOH expenditure. This in turn was largely explained by a decline of more than 80% in malaria control expenditure, and a more modest reduction in Family Health Bureau (FHB) expenditure during the late 1990s. The decline in malaria control expenditure was due to adoption by the health ministry of a more efficient vector-control strategy in accordance with WHO recommendations, and thus represents a productivity improvement. Overall performance of the malaria control programme was maintained, hence reflected in declining caseloads throughout the decade and effective elimination of local transmission of malaria at the end of 2012. The reasons for the decline in FHB spending are unclear, but again available data on outcomes do not indicate that this resulted in deterioration in performance. Despite the declining share, it must be noted that overall expenditure in rupee terms did not fall.

Preventive care is mainly financed by the public sector, but its share fluctuated between 71% and 91% during 1990–2014.

Figure 14: Flow of expenditure on medicines in the health sector, 2013

(a) Public sector purchases are mostly made by the Ministry of Health Medical Supplies Division (MSD) and then distributed to government health institutions.

(b) Private sector expenditure at CIF (cost, insurance and freight) prices.

(c) This refers to the small quantities of medicines that some government hospitals are permitted to self-purchase from their own budgets.

Note: Public sector expenditure is valued in terms of actual purchase prices paid by MOH and MOH institutions. Private sector expenditure is valued in terms of wholesale prices, which are the prices normally paid by retailers to obtain their stocks. Actual retail prices paid by pharmacy customers are higher, as illustrated in the inset box. Wholesale prices are in turn higher than CIF prices which are what imported medicines costs when landed at the port.

Source: IHP staff estimates using data from a numerous sources, including MoH and IMS-Health.

4.2 Pharmaceutical expenditure

The category of expenditure reported by the SLHA as “Medical goods dispensed to outpatients” includes expenditure on providing medicines to outpatients as well as expenditure on providing other medical goods, such as eye-glasses or wheelchairs. Much of this reported expenditure involves purchases by households at pharmacies and other retail outlets. In the government sector, they include mostly spending on providing medicines distributed at outpatient dispensaries, and some other medical goods and supplies distributed from outpatient facilities. They should not be interpreted as being equivalent only to expenditure for medicines.

Furthermore, it is important to note that the expenditure on medicines included in this category only accounts for a proportion of overall expenditure on medicines in Sri Lanka’s health sector. Following international reporting standards, the SLHA does not separate out expenditure on medicines and medical supplies used for inpatient care in public and private hospitals, and this expenditure is included in the category of inpatient expenditure.

This is illustrated in Figure 14, which provides an overview of the overall expenditure on medicines in Sri Lanka’s health sector in 2013. As can be seen, other than the supplies of medicines to outpatients by pharmacies and government outpatient departments, the use of medicines by public and private hospitals and dispensing doctors is substantial. Public financing dominates the financing of medicines used in inpatient care. The expenditure by government on supplying medicines to inpatients is far greater than the amount it spends on outpatient medicines, and also greater than the amount spent on inpatients in the private sector. In considering expenditure on medicines in the private sector, it is worth noting that the flow of medicines in the private sector can be valued in different ways, depending on whether the cost is taken at the point of importation, or at the wholesalers, or at the point of sale to patients (see inset chart in Figure 14). The latter price in the case of pharmacies also includes the mark-up on medicines, which is used to cover the operating costs of running pharmacies. When making comparisons between public sector and private sector purchases, it is probably better to use the values of expenditure at wholesale prices in the private sector. The SLHA itself reports pharmacy sales at retail prices in the functional category referred to as “pharmaceuticals and other medical non-durables”.

5. Health expenditure by providers

5.1 Current expenditure

The institutions and organizations where current health expenditure is incurred in order to deliver healthcare services and goods are systematically classified by provider type in the SLHA (Figure 15). This classification is based on the SHA system, with appropriate modification to the Sri Lankan context.

Four major categories of providers accounted for much of the current expenditure in 2013: hospitals (47%), providers of ambulatory health care (18%), providers of ancillary services (7%) and retailers involved in the sale and distribution of medical goods (21%). In 2014, the hospital share is estimated to have increased further to 50%. Ambulatory care providers consist mainly of the clinics of private physicians and dentists, and government outpatient facilities such as MOOH units and dispensaries. Retail distributors are predominantly private pharmacies.

Expenditure at hospitals has become the largest spending component, with its share increasing from 31% in 1990 to 47% in 2013 (Figure 16 and Table 11). The trend was largely at the expense of spending at ambulatory care providers, where the share decreased from 27% to 18%. Spending at pharmacies ranged between 19% to 24% and was 21% in 2013, and provisionally 19% in 2014.

come from MOH (Table 13 and Table 14). This is partly due to transfers of hospitals from PDOH control to MOH control, and partly owing to faster rates of increase in spending at higher-level government hospitals, which are more likely to fall under MOH responsibility.

5.3 Non-hospital spending

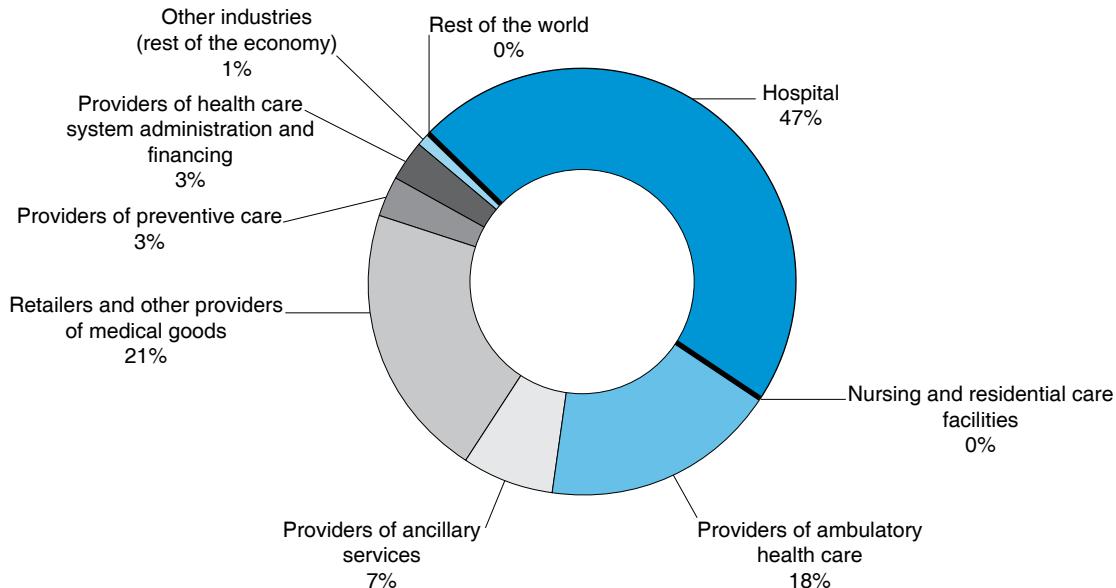

Much of non-hospital spending occurs at ambulatory providers such as physician clinics and pharmacies. Both of these have shown some decline in share, as spending on curative services has shifted to hospitals (Table 11). Of the remaining non-hospital spending, the largest components are spending by agencies involved in providing and administering public health services, which are almost exclusively MOH programmes and units (3% in 2013), and those involved in health administration (3%). Spending by agencies providing public health services has halved as a share of total current spending (from 6% in 1990 to 3% in 2013), in line with the overall slow increase in spending on public and preventive health services by the government. Government departments account for the large part of those agencies providing health administration, but this category also includes a significant amount of expenditure by private health insurance companies to administer private health insurance firms.

5.2 Hospital spending

Hospital spending by source of financing

Hospital expenditure is mostly financed by public sources, but public sector financing of hospitals has shown some reduction from 84% in 1990 to 77% of the total by 2013 (Table 12 and Figure 17). Private sector financing on the other hand has increased from 16% to 23% during the same period, largely owing to increases in the turnover at private hospitals, which are exclusively financed by private expenditure (household out-of-pocket spending and private health insurance).

Government expenditure at hospitals is almost exclusively by MOH and PDOH, and is spent at hospitals operated by them. Over time, an increasing proportion of government hospital spending has

6. Health expenditure by province and district

6.1 Trends in current and government provincial spending

The Sri Lanka health accounts disaggregate health expenditure by province wherever possible, for all years since 1990. This report provides district estimates for public per person expenditure for 1990, 1995, 2000, 2005 and 2011–2014. The basis on which expenditure is assigned to a province or a district is given in Box 1, and users should apply appropriate caution when interpreting or using these statistics.

Excluding expenditure spent on national collective services and all-island wide personal medical services, 92% of current expenditure in 2013 can be located by province. Of these, the Western Province incurred the highest volume of expenditure, while the Northern Province incurred the lowest (Table 15). For years prior to 2005, the Eastern and Northern Provinces are treated as one unit for reporting purposes but, as indicated by the statistics for 2005–2014, spending in the Eastern Province was greater in those years than in the Northern Province.

Much of these differences in the volume of spending by province can be explained by the differences in population of each province. Table 16 presents the trends in per capita government health expenditure by province. This shows that the public per capita health expenditure was lower in the Sabaragamuwa and North-Western Provinces than in the rest of the country. However, it should be noted that much of the government expenditure in the Western Province is at teaching and specialized hospitals where a significant but unquantifiable percentage of patients are referred from other provinces.

Owing to deterioration in the availability and quality of data from conflict areas during previous years, the estimates of public per capita spending in the Northern and Eastern Provinces are subject to considerable uncertainty and lack of reliability. The major reason for this is the lack of reliable and accurate population estimates for most districts in these two provinces during the past two decades. These statistics, especially those for per capita spending, should be used with caution.

Box 1: Basis for geographical distribution of expenditure

In the SLHA framework, expenditure is allocated geographically according to the area in which the benefiting individuals reside. If a person receives healthcare treatment in a district outside the one where he/she normally lives, the expenditure should be allocated to the district where he/she originates. However, only for a few expenditure items does the available data readily identify the area of residence of those receiving services. In practice, for most of the expenditure items assumptions are necessary in order to estimate the relevant areas and, in many cases, owing to the scarcity of data, the expenditure can only be allocated to the district in which the services are provided. The latter is particularly the case with expenditure at government health facilities and private hospitals, where the current SLHA estimates assume that those using the services at any facility reside in the same district. This is an approximation, since for example many patients at government hospitals in Colombo come from other districts. Such limitations in the methods should be borne in mind when using these statistics.

Sometimes, not all health expenditure can be directly or usefully assigned to a province or district. This is particularly the case for expenditure on public or collective health services, which benefit large numbers of people, and not specific individuals, and for expenditure to treat patients from certain populations such as the military. Consequently, the SLHA geographical estimates are based on the following principles:

- (i) Expenditure that is for the benefit of individuals or the population residing in a specific province is classified as expenditure in that province.
- (ii) Expenditure for programmes with the specific purpose of providing personal medical services to individuals employed in the armed forces or police or individuals resident in prison institutions are classified as national level expenditure (as these individuals cannot be regarded as part of the normal population of a province and because it is not practical to make such disaggregation).
- (iii) Expenditure that is for the collective benefit of national or provincial populations is classified as national or provincial-level collective expenditure. Examples include the cost of maintaining the MOH headquarters and certain national or provincial-level public health programmes such as health education for HIV/AIDS.

Table 15: Current health expenditure by province (Rs. million), 1990–2014

Year	Western	Central	Southern	Northern ^(a)	Eastern ^(a)	North-Western	North-Central	Uva	Sabaragamuwa
1990	4,003	962	1,208	589		798	576	382	576
1991	4,723	1,095	1,369	619		912	639	416	655

2014 ^(b)	127,228	25,462	29,901	8,666		12,194	22,861	12,612	13,946
								11,367	15,446

(a) Prior to 2007, the Northern and Eastern Provinces functioned as a single administrative unit; the North-East Provincial Council. Consequently, many administrative data sources only reported expenditure for the two provinces combined, and currently it is not feasible to estimate the distribution of spending between the two provinces for earlier years. Consequently, the table displays the expenditure as estimated for both provinces combined for years prior to 2005.

(b) Provisional.

Note: The total of all the provincial spending reported in this table does not equate to CHe, as spending on all-island wide personal medical services and national collective services are not included.

(a) Prior to 2007, the Northern and Eastern Provinces functioned as a single administrative unit; the North-East Provincial Council. Consequently, many administrative data sources only reported expenditure for the two provinces combined, and currently it is not feasible to estimate the distribution of spending between the two provinces for earlier years. Consequently, the table displays the expenditure as estimated for both provinces combined for years prior to 2005.

(b) Provisional.

- Notes
 1. Population figures used for provincial calculations were derived as follows: Census data for mid year population was used for 1981, 2001 and 2012. Time series from 1981 to 2012 was estimated based on population growth for inter-census years.
 2. The total of all the provincial spending reported in this table does not equate to CHIE, as spending on all-island wide personal medical services and national collective services are not included.
 3. Per capita estimates for the Northern and Eastern Provinces are not reliable due to large uncertainties in the statistics for provincial populations.

Source: IHP Sri Lanka Health Accounts Database.

Figure 18: Current health expenditure by province (Rs. million), 1990–2014**Notes**

1. Northern and Eastern Provinces are represented as a merged province for the years prior to 2005. Therefore, the column representing the Northern Province is in fact the merged province of North and East for the years prior to 2005.

2. 2014 estimates are provisional.

Source: Table 15.

6.2 Provincial expenditure by source

Financing from private sources accounted for the bulk of expenditure in the Western, Southern, North-Western and Sabaragamuwa Provinces (Table 17 and Figure 19). Most of this variation is explained by private spending for outpatient care, and medical goods dispensed to outpatients. Spending in the Uva Province was mostly public, while in the Central, North-Central and Sabaragamuwa Provinces it was mostly private in the early 1990s, and became more public towards the end of the time period under review.

In the Western Province, the share of private spending has increased over time reaching 75% by 2013, while the share of private spending fell from 53% in 1990 in the Central Province to 41%. A similar decline is observed in the North-Central Province where the private share decreased from 57% to 40% during the same period.

It can be seen from Figure 20 that per capita spending by private sources in 2013 was comparatively high

in the Western, Southern and North-Western Provinces. The highest total per capita private spending in 2013 was estimated at Rs. 14,566 in the Western Province. Figure 21 shows that public sector health expenditure on a per capita basis was highest in the Northern and Uva Province, while the Sabaragamuwa and North-Western Provinces had the lowest level.

Notes

- Excludes expenditure on all-island wide personal medical services and national collective services (See Box 1).
- The size of the pies are representative of the value of CHE.

6.3 Hospital expenditure by province

Figure 22 presents expenditure on hospitals in public and private sectors for each province. Expenditure at private hospitals was highest in the Western Province as would be expected due to the high concentration of hospitals in Colombo, followed by the Central and Southern Provinces.

6.4 District expenditure

IHP continues to work on disaggregating the SLHA estimates by district, but this remains a work in progress owing to continuing data limitations. As in previous reports, this publication provides estimates of public expenditures by district (Table 18). The Northern and Eastern Provinces were administered as one unit for earlier years with a single Provincial Council administration. Consequently, many administrative data sources only reported expenditure for the two provinces combined, and it is not currently feasible to estimate the distribution of spending between the two provinces for the years prior to 2005. Disaggregation of spending at district level in the Northern and Eastern Provinces remains difficult, partly due to uncertainties over the size of district populations, and so for these provinces estimates are made only at provincial level. On a per capita basis, the highest government spending was in Colombo followed by Kandy (Figure 23).

District-level estimates for private expenditure have been prepared on an experimental basis and published in this report for the year 2013. Estimates of expenditure at private hospitals and expenditure on pharmaceutical purchases at pharmacies and other retail outlets are presented in Figure 24 and Figure 25.

Expenditure at private hospitals was assigned to the district where the facility is located, assuming that those using the services reside in the same district. Current SLHA district allocation of expenditure at government health facilities and private hospitals is based on this assumption owing to scarcity of data on actual residence of beneficiary. The highest expenditure at private hospitals was in Colombo followed by Gampaha, Kandy, Galle and Matara. The lowest levels of expenditure were in Hambantota, Mannar, Mullaitivu, Killinochchi and

Nuwara Eliya districts, which have either no private hospitals or a low number.

District-level estimates of private expenditure on pharmaceutical purchases at pharmacies and other retail outlets are presented in Figure 25. District allocation of expenditure was computed based on the information available at the household level using the HIES conducted by DCS. The highest level of expenditure was in Gampaha and Colombo while the second highest level was in Kalutara. Other than the districts in Northern and Eastern Provinces, Moneragala also showed the lowest level of expenditure on pharmaceutical purchases at pharmacies and other retail outlets in 2013.

Table 18: Public current health expenditure per capita by district (Rs.), 1990, 1995, 2000, 2005, 2005, 2011-2014

Ratnapura	125	278	603	1,330	2,832	3,128	4,076	4,810
Kegalle	94	179	537	1,257	2,680	2,946	3,596	4,231

(a) Prior to 2007, the Northern and Eastern Provinces functioned as a single administrative unit: the North-East Provincial Council. Consequently, many administrative data sources only reported expenditure for the two provinces combined, and currently it is not feasible to estimate the distribution of spending between the two provinces for earlier years. The table displays the expenditure as estimated for both provinces combined for years prior to 2005.

(b) District level per capita estimates of the Northern and Eastern Provinces for 2005–2011 are not reliable due to large uncertainties in the statistics for district populations. These limitations mean that it is not possible to provide individual district estimates for the Northern and Eastern Provinces for 2005–2011. District level estimates of Northern and Eastern Provinces in 2012 were computed based on 2012 census data on mid year population.

(c) Provisional.

Notes

1. Population figures used for provincial calculations were derived as follows: Census data for mid year population was used for 1981, 2001 and 2012. Time series from 1981 to 2012 was estimated based on population growth for inter-census years.

2. The total of all the district spending reported in this table does not equate to CHE, as spending on all-island wide personal medical services and national collective services are not included.

3. “—” represents that an estimate is not available for the year.

7. Revenues of health care financing

7.1 Trends in revenues of financing

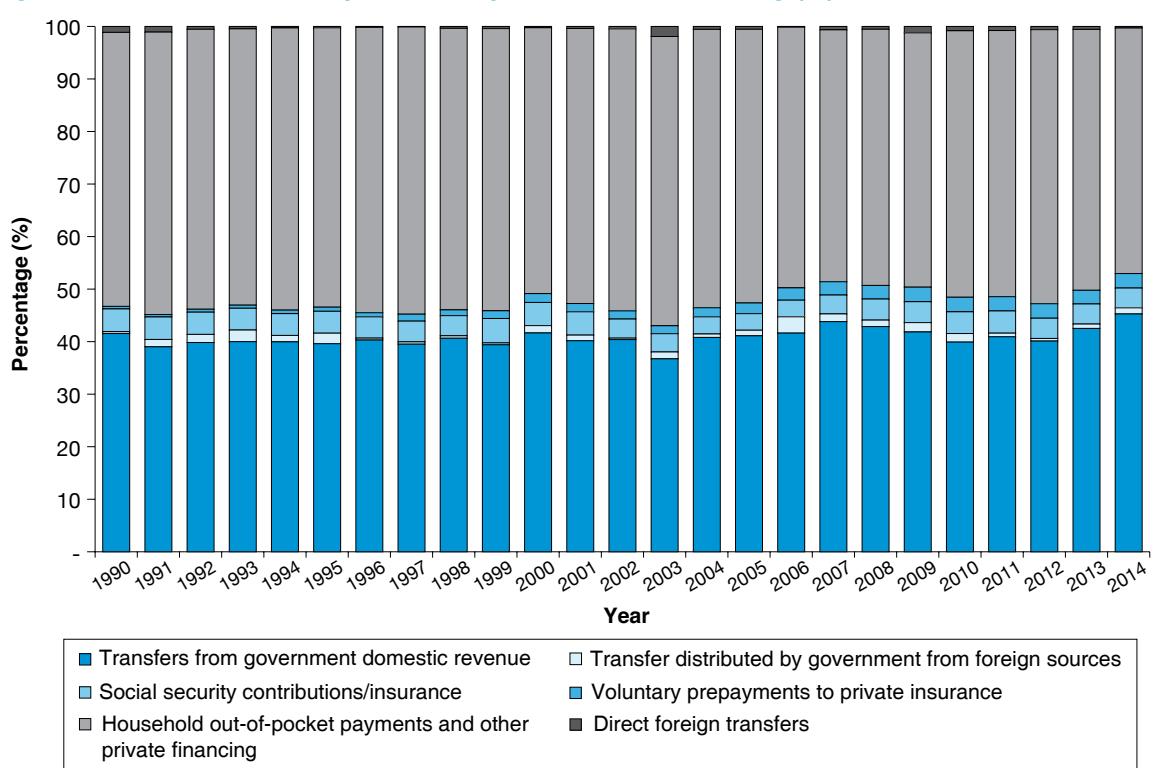

In this revision, the SLHA is extended to show from which sources financing schemes and institutions obtain their funding. These are classified as revenues of financing following the SHA 2011 framework. This presentation shows how much revenue is collected in different ways and through which entities that revenue or financing is channelled.

Transfers from government domestic revenue refers to government health financing that is funded from taxation; this includes taxes and other non-tax revenues of government at all levels, including central, provincial and local. Transfers distributed by government from foreign sources refers to grants provided by foreign entities, such as development partners, that are used by any level of government to finance the health sector. This category of spending does not include loans taken by government for financing health, which ultimately have to be paid back by government using its tax resources. Social security contributions refer to all compulsory payments that provide an entitlement to receive future social benefit. In Sri Lanka these consist of reimbursements of health care payments made through Employees Trust Fund, Agrahara insurance, enterprise direct payments and

reimbursements for health. Voluntary prepayments to private insurance consist of premiums paid by companies and households to insurance companies to obtain medical insurance coverage. Household out-of-pocket payments and other private financing refer to household, and non-profit sector payments. Direct foreign transfers refers to grants provided by foreign entities, such as development agencies or NGOs, that are provided directly to financing schemes or institutions without passing through government. In Sri Lanka these mainly consist of funding provided by official multilateral or UN agencies and official bilateral agencies from countries such as Japan and Korea.

Transfers from government domestic revenue accounted for 43% of current health expenditure in 2013, predominantly general tax revenue collected by central government. This share is provisionally estimated to have increased to 45% in 2014. Transfers distributed by government from foreign sources was 1% while direct foreign transfers was also 1% in 2013 (Table 19). Household out-of-pocket payments and other private financing were 50% and voluntary prepayments for private insurance were 3% of current expenditure on health in 2013, with the household/other private contribution falling to 47% in 2014 (provisional estimates).

8. International comparisons

8.1 Comparability of Sri Lanka health accounts estimates

The Sri Lanka health accounts framework is designed to be consistent with the OECD SHA standards, and so the SLHA expenditure estimates are directly comparable with other SHA-based estimates of spending in other countries and territories. The Institute for Health Policy is a member of APNAN and, through this network, IHP collaborates with OECD, WHO and other similar agencies in the region to compile comparable data on health spending in regional countries and territories. This section uses this data to compare health spending in Sri Lanka with other economies. In all the tables and figures, Sri Lanka and other economies are arranged in order of increasing per capita GDP so as to further aid comparison.

8.2 Current health expenditure and sources of financing

Current expenditure on health in Sri Lanka at 3.0% of GDP in 2013 is comparable to spending levels in other lower-middle income economies in the region (Table 20). It is slightly higher than in Bangladesh

(2.9%) but lower than Thailand (3.7%) and Malaysia (3.8%). In general, levels of aggregate health spending in economies are closely linked to income levels, with spending per capita increasing with income levels. Figure 26 shows how the relationship between log of per capita health spending and log of per capita GDP is quite consistent and linear between economies at different income levels in Asia. The figure also indicates that spending in Sri Lanka is actually a little less than might be predicted for its income level.

In general, the share of public financing in total financing increases with increasing income (Table 21). The 43% share in Sri Lanka is much higher than in poorer Asian economies, such as Bangladesh (21%), but at the same time much less than in more developed economies such as Japan (83%), Thailand (74%) and Australia (68%). However, the sources of public financing differ between economies such as Japan, Korea and Taiwan relying significantly on social insurance in addition to general government financing (essentially from taxation). It is worth noting that the overall pattern of financing in Sri Lanka, with its predominant reliance on general government financing with no social insurance and a mix of out-of-pocket and employer spending, most resembles that in Malaysia and Hong Kong (Figure 28).

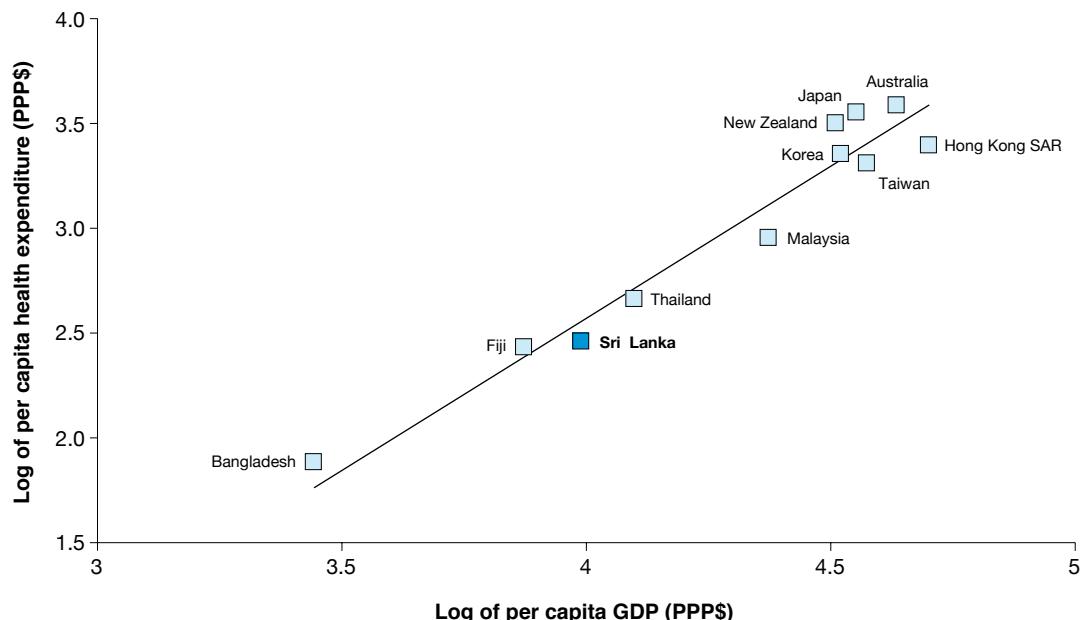

Table 20: General economic indicators and health expenditure for selected countries in the Asia-Pacific region

Territory	Year	GDP per capita (US\$)	GDP per capita (PPP\$)	Current expenditure on health (US\$ million)	Per cap health expenditure (US\$)	Per cap health expenditure (PPP\$)	Current health expenditure (% GDP)

8.3 Composition of spending by function and providers

Figure 29 and Table 22 provide details of the distribution of spending by functions in Sri Lanka compared with other regional economies. The share of spending that is for inpatient care in Sri Lanka is higher than in Bangladesh and Taiwan but otherwise similar to the proportions seen in wealthier economies such as Australia and Hong Kong. The share of spending accounted for by sales of medicines by pharmacies is significantly less than in Bangladesh, but comparable to the levels seen in countries such as Japan and Korea. However it must be noted that in economies such as Hong Kong and Taiwan, a much larger volume of medicines are distributed by dispensing physicians

than is the case in Sri Lanka. In the case of preventive health spending, the share in Sri Lanka of 5% is again somewhere in between the poorer economies such as Bangladesh where it is 14% and more developed economies such as Korea and Australia, where it is around 2–4% of total spending.

Figure 30 and Table 23 provide details of the distribution of spending by providers in Sri Lanka compared with other regional economies. Again, the spending patterns in Sri Lanka resemble the more developed economies in the region such as Korea, New Zealand and Hong Kong, with comparable proportions of spending taking place in hospitals, outpatient and ambulatory care providers, and retailers of medical goods.

9. Technical notes

9.1 General

The Institute for Health Policy reports health expenditure domestically using the Sri Lanka Health Accounts (SLHA) framework. The first version of this framework was originally developed during 1998–99 for the Ministry of Health by a team led by Rannan-Eliya and Somanathan, and it was designed to be compliant with pre-publication versions of the OECD SHA. The SHA was later published in 2000, and since then the health accounts team at IHP has continuously revised and updated the framework to ensure compliance with the SHA standards, which is the approach endorsed by WHO for international reporting of health expenditure statistics. A revision of the SHA standard was released in 2011, and this publication presents first estimates consistent with the new SHA 2011 format.

The SLHA framework, in line with the SHA approach classifies all health spending according to three dimensions: sources of financing, providers and functions. In addition, the most recent version of the SLHA framework also classifies expenditure geographically, both by province and by district. For the three core dimensions, SLHA categorizes all spending according to classification systems, which are based on the relevant SHA classifications, but with appropriate modification and revisions to ensure relevance and applicability to the country's health system. When revisions to the SLHA framework are made, IHP always revises earlier estimates to be compliant with the revised framework to ensure consistency in reporting of expenditure for different years.

A key design element of the SLHA framework and its classifications is that they correspond in a defined way to the parallel elements of the SHA framework. This means that IHP is able to report health expenditure in Sri Lanka simultaneously using both the national SLHA framework and also according to the OECD SHA framework. In the main part of this report, expenditure has been reported according to the SLHA framework and classifications. However, to aid international comparison, the statistics used in Section 8 for Sri Lanka are based on the SHA definitions so as to ensure overall comparability. The Appendix of this report provides a full set of tables showing health expenditure in Sri Lanka using both SHA formats (SHA 1.0 and SHA 2011) for selected years between 1990 and 2014.

9.2 Definitions

Current health expenditure (CHE)

The term 'health expenditure' refers to expenditure on health goods and services and health-related investment. Health goods and services expenditure includes expenditure on health services (medical treatments and diagnosis), health goods (medications, aids and appliances), and other health services such as expenditure on public health, research and administration. This expenditure is collectively termed 'current expenditure'. Health-related investment is also referred to as 'capital formation' or 'capital expenditure'. The SLHA definition of health expenditure is fully consistent and comparable with that in the OECD SHA standards.

CHE, as reported in the SLHA estimates, is equivalent to CHE as defined by the SHA 2011, and is only a subset of all health and health-related expenditure. Current health expenditure includes only direct health expenditure, and excludes health-related expenditure such as research and training.

Current health expenditure for Sri Lanka as currently estimated and reported in the SLHA estimates is slightly underestimated, as certain categories of spending are not currently measured in full. These principally consist of expenditure by non-profit institutions, for which there are no comprehensive data sources and so are partially estimated, and expenditure by households on long-term care, which are not estimated at all. This expenditure, which is not included, may represent 1-2% of total spending.

The SLHA framework requires that health expenditure be measured on an accrual basis, consistent with the recommendations of the SHA. However, in practice data limitations mean that several major elements of spending are in fact measured and reported on a cash base. These include all government health expenditure and some parts of household out-of-pocket expenditure.

Financing sources

Institutions that pool health resources collected from different sources, as well as entities (such as households and firms) that pay directly for health

care using these resources are called financing sources. They are classified in the SLHA into public and private financing sources, and those which are outside the country. The major financing source categories are:

- Government, comprising central government, Provincial Councils, local governments and social security institutions such as the Employees Trust Fund (ETF)
- Employers, who directly finance or reimburse healthcare services for their employees
- Insurance schemes that pay for healthcare
- Households that pay directly out-of-pocket for healthcare goods and services
- Non-profit institutions (both domestic and foreign)
- Providers who use their own resources to finance healthcare activities.

Functions

Functions are the purposes for which healthcare expenditure are used. The SLHA classifies expenditure according to function, distinguishing between direct health expenditure and health-related expenditure. Health-related expenditure includes capital expenditure, as well as expenditure on training, environmental health and research. Only direct health expenditure included in the definition of CHE.

The major functional categories of direct health expenditure consist of:

- Inpatient and day care
- Outpatient curative
- Services of rehabilitative and long-term nursing care
- Ancillary services to health care, comprising laboratory and other diagnostic services and patient transport
- Medical goods dispensed to outpatients, comprising medicines and other medical goods and supplies
- Prevention and public health services, which are services intended to improve or promote the health of the population or groups within the population, including maternal and child health programmes, immunization programmes and health education activities
- Health administration and health insurance administration

Providers

Providers are the entities that engage in the production and delivery of healthcare goods, services and activities.

The major provider categories used in the SLHA framework consist of:

- Hospitals, which are institutions that treat inpatients
- Nursing and residential care facilities
- Providers of ambulatory care, comprising facilities of physicians, dentists and other health professionals which deliver care only on an outpatient basis
- Retail sale and other providers of medical goods, comprising retail pharmacies, shops and other providers who distribute medicines and other medical goods and supplies
- Provision and administration of public health programmes, comprising agencies involved in delivering public health functions and activities
- General health administration and insurance, comprising agencies responsible for health administration, and administration of health insurance schemes.

Revenues of financing

Revenues of financing are the sources from which financing schemes and institutions obtain their funding. The major categories are:

- Transfers from government domestic revenue
- Transfers distributed by government from foreign sources
- Social security contributions/insurance, including reimbursements of health care payments made through Employees Trust Fund, Agrahara insurance, enterprise direct payments and reimbursements for health
- Voluntary prepayments to private insurance
- Household out-of-pocket payments and non-profit sector payments
- Direct foreign transfers

9.3 Data sources

General

IHP continuously collects information from a wide range of government and private sources in order to compile the SLHA estimates. IHP also conducts regular surveys of the health sector in order to augment these data sources. The information collected is then analysed in assisting the development of the final estimates that are published. A variety of estimation techniques are used to do this, with different methods being used to estimate different elements of spending.

"Guidelines for Improving the Comparability and Availability of Private Health Expenditure Under the System of Health Accounts Framework" (Rannan-Eliya and Lorenzoni 2010). These guidelines were in fact based on work carried out in Sri Lanka and have been adopted by OECD statisticians. A variety of data sources are used to estimate private spending, with different sources being used for specific elements. Major data sources include national surveys of household expenditure by the Department of Census and Statistics and by the Central Bank, surveys of private hospitals and other providers conducted on a regular basis by IHP, and data obtained from various industries.

Central government

Overall spending by central government ministries and departments is based on the audited actual accounts of the Government of Sri Lanka as reported by the government's Computer Integrated Government Accounting System (CIGAS). Data on expenditure by other central agencies, including the armed forces, Police, ETF and the President's Fund are obtained directly by contact with the relevant authority.

Provincial and local governments

In the past, the spending of Provincial Councils was estimated from the Financial Statements of each Provincial Council and other data provided by the Finance Commission. These provided information on actual expenditure with a two-year delay. Now, with the adoption by the provincial councils of CIGAS-type electronic accounts systems, IHP can make use of electronic accounts data. This has made it possible to reduce the previous time lag of 2–3 years in reporting Provincial Council expenditure to 1–2 years. Expenditure by local governments is based on data collected by IHP in an annual survey of local government health expenditure. The methodology and design of this survey was substantially revised during 2009–10.

Private sector spending

Private expenditure is estimated using the best practice methods recommended by OECD, in its

9.4 Methods used

Government spending

Data on aggregate government spending is obtained from CIGAS. These differentiate expenditure by different departments and ministry programs. However, for the detailed analysis of expenditure by institutions and functions, a variety of other data sources and methods are necessary. These include:

- The detailed allocation of spending on activities of central programmes is based on additional data and information provided by the directors and staff of each programme, for example, the Family Health Bureau.
- The allocation of hospital expenditure by type of hospital and by function is principally based on analysis of data from cost surveys of government hospitals, which were conducted in 1991, 1997 and 2006. The most recent of these was the IHP-MOH Public Health Facility Survey 2006, which collected detailed data on costs and activities in a representative sample of over 70 government health institutions.
- The allocation of expenditure on medicines and supplies to different institutions and regions, and functions within hospitals, is based partly on data collected in hospitals by the IHP-MOH Public Health Facility Survey 2006, and partly on data provided by the Medical Supplies Division of MOH.

Fees paid to government healthcare institutions

Collections of official fees paid to government hospitals and facilities are reported in the CIGAS accounts and Provincial Council financial statements. In addition, the revenues of autonomous board-run hospitals are obtained from their annual reports.

Private hospital spending

The estimates of private hospital spending are based on data obtained in regular surveys of private hospital institutions conducted by IHP, supplemented with information extracted from the published financial accounts of a number of hospitals.

Sales of medicines from pharmacies

Expenditure on the distribution of medicines by retail outlets, primarily pharmacies, is based on data reported in the Sri Lanka Pharmaceutical Audit (SLPA) conducted by IMS-Health Sri Lanka. Adjustments are made to these data to account for gaps in the survey coverage of SLPA.

Private dental practitioners

Estimates of spending at private dental practitioners are based on the national accounts estimates of the Department of Census and Statistics and the National Oral Health Surveys. These are considered to be underestimates, but data are currently lacking to improve the numbers.

Employer medical benefits

This expenditure is estimated using data from occasional sample surveys of large employers in the

country. The survey data used distinguishes between employer direct financing of medical benefits for their employees and payments to insurance companies to provide medical insurance. The latter is deducted in order to arrive at the final estimates. The methodology and design of this survey was substantially revised in 2013.

Private health insurance expenditure

This expenditure is based on regular IHP surveys conducted on the activities of commercial health insurance schemes. These provide data on aggregate expenditure, as well as their allocation to different types of healthcare goods and services.

Private practitioners and other miscellaneous items of household expenditure

Payments to private practitioners are estimated from a variety of data sources. These include occasional surveys of private doctors, including the Sri Lanka Private Clinic Survey 2000, and household surveys of out-of-pocket expenditure, including the Central Bank Consumer Finance Surveys 1996/97 and 2003/2004, and the Department of Census and Statistics Household Income and Expenditure Surveys. Various adjustments are made to these data in order to derive estimates that are consistent with all the available information.

Other items of household expenditure are estimated mainly from data of various national household surveys. Such items include household expenditure at indigenous medical practitioners, for laboratory and diagnostic services, and purchases of optical glasses and other medical durables. These data are adjusted during estimation for known biases in survey reporting.

10. Appendix A:

SHA 1.0 standard tables showing health expenditure in Sri Lanka by financing source, provider and function for selected years

12. Glossary

All-island wide personal medical services	Expenditure for programmes providing personal medical services benefiting individuals employed in the armed forces, police or resident in prison institutions. These individuals are not regarded as part of the normal population in each province. Furthermore, it is not practical to make such disaggregation.
Capital formation	The sum of expenditure on fixed assets (e.g. new buildings and equipment with a useful life extending over a number of years).
Current Expenditure	Expenditure incurred by organisations on a recurring basis for the provision of health services, excluding capital expenditure, but including indirect expenditure.
Employer medical benefits	Health expenditure paid for/reimbursed directly by the employer to the employee.
Employees Trust Fund (ETF)	A form of social security for persons in paid employment, where the employer pays 3% of the gross salary to the fund on behalf of the employee, which can be withdrawn by the beneficiaries at retirement or prematurely for specific reasons, including some types of medical expense.
Gross domestic product	A statistic that refers to the total market value of goods and services produced within a given period, after deducting the cost of goods and services used up in the process of production, but before deducting allowances for consumption of fixed capital.
Implicit price deflator	A GDP price deflator that is calculated by dividing its nominal GDP component by the chain volume measure of real GDP.
Inflation	The increase in the price level of goods and services in the economy
Inpatient	Care for a patient who is formally admitted (or 'hospitalised') to an institution for treatment and/or care, and stays for a minimum of one night in the hospital or other institution providing in-patient care.
Medical goods dispensed to outpatients	This item comprises medical goods dispensed to outpatients and the services connected to dispensing such as retail trade, fitting, maintaining and renting of medical goods and appliances. Services of public pharmacies, opticians, sanitary shops, and other specialized or non-specialized retail traders are included here. For the most part, this item consists of the retail sale of medicines by pharmacies.
Outpatient	A patient who is not an inpatient (not hospitalized), but instead is cared for elsewhere – as in a doctor's office, clinic, or day surgery centre. Outpatient care is also called ambulatory care.
Public health	Services that are aimed at protecting and promoting the health of the whole population or specified population subgroups, and/or preventing illness, injury and disability in the whole population or specified population subgroups. Public health services do not include treatment services. In the SLHA, public health services include: maternal and child health programmes, family planning, preventive health programmes, school health services and nutritional activities with a primary health purpose.
Real expenditure	Expenditure expressed in terms, which have been adjusted for inflation. This enables comparisons to be made between expenditure in different years.
System of health accounts (SHA)	A standardized framework for reporting and classifying health expenditure developed by the OECD and endorsed by WHO for the purposes of international reporting by countries.

De Alwis, S.S., Rannan-Eliya, R.P., Dalpatadu, K.C.S., Amarasinghe, S.N., Elwelegedara, R. and Saleem, S., “*National AIDS Spending Assessment 2009-2010*”. April 2012.

“Sri Lanka Health Accounts: National Health Expenditure 1990–2014” profiles expenditure on health in Sri Lanka during 1990–2014. It presents the latest estimates of health spending from Sri Lanka’s health accounts, which have been developed by IHP experts over many years to be fully compatible with international standards for reporting of health expenditure. For the first time, the publication also reports health expenditure in Sri Lanka according to the new SHA 2011 international standard. Current health spending in 2013 was Rs. 258 billion, which was equivalent to 3.0% of GDP, and Rs. 12,535 per capita. The government directly financed 43%, while the remaining 56% was financed by private sources, and 1% by donor agencies.

The report present expenditure estimates:

- both public and private spending
- at the aggregate or total level
- as a proportion of gross domestic product
- on a per person basis
- by province and district
- by source of funding, function and provider
- by revenue sources and financing schemes
- in comparison with selected other Asia-Pacific territories
